Wildfire G90228
Boundary Sample Area
Demo

Legend

G90228 Boundary (2024)

NBR Value Change

0.882476

-0.54475

This is a demo map that shows the NBR (normalized burn ratio) inf 2024 for a sampled fire area perimeter of the "zombie" Nogah Creek, BC wildfire (identified as G90228 by the BC govt). The wildfire was burning in July 2023 and was re-ignited on May 05, 2024 after it was buried during the winter of 2023. The NBR difference is used for measuring burn severity and a higher value means more severity. Bands 5 and 7 for Landsat images LC09_L1TP_048019_20240808_20240808_0 and LC09_L2SP_048019_20240504_20240505_0 were used for the after wildfire and before wildfire images for NBR analysis respectively.
