

Road Network Preparation

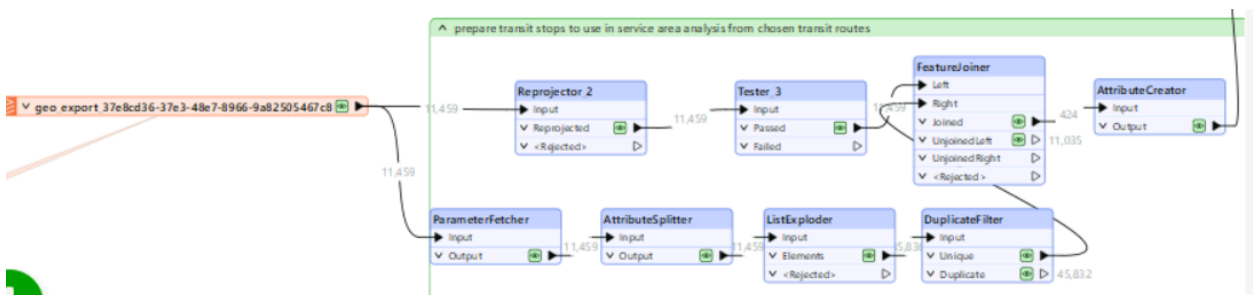

1. Read road network feature type
2. Project it to correct coordinate system
3. Create intersections in line features

Bike routes

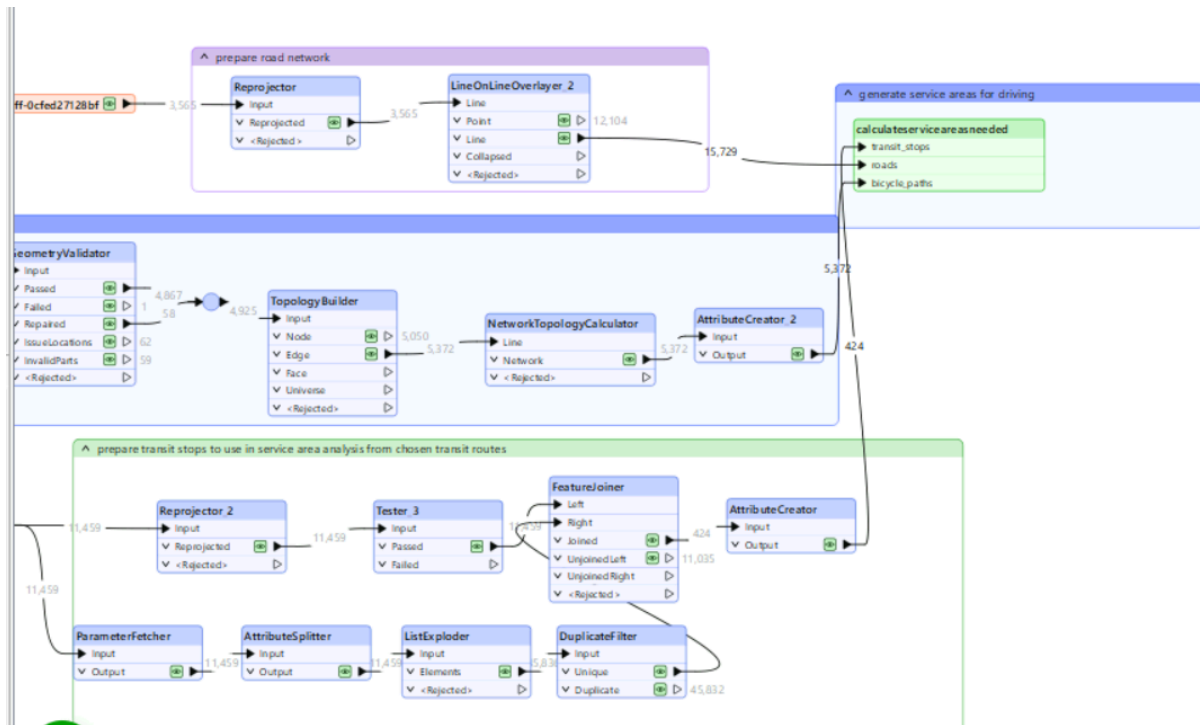

1. Read bike routes
2. Project it to correct coordinate system
3. Ensure bike route topology is good
4. Create speed attribute for bike routes

Transit Stops to use

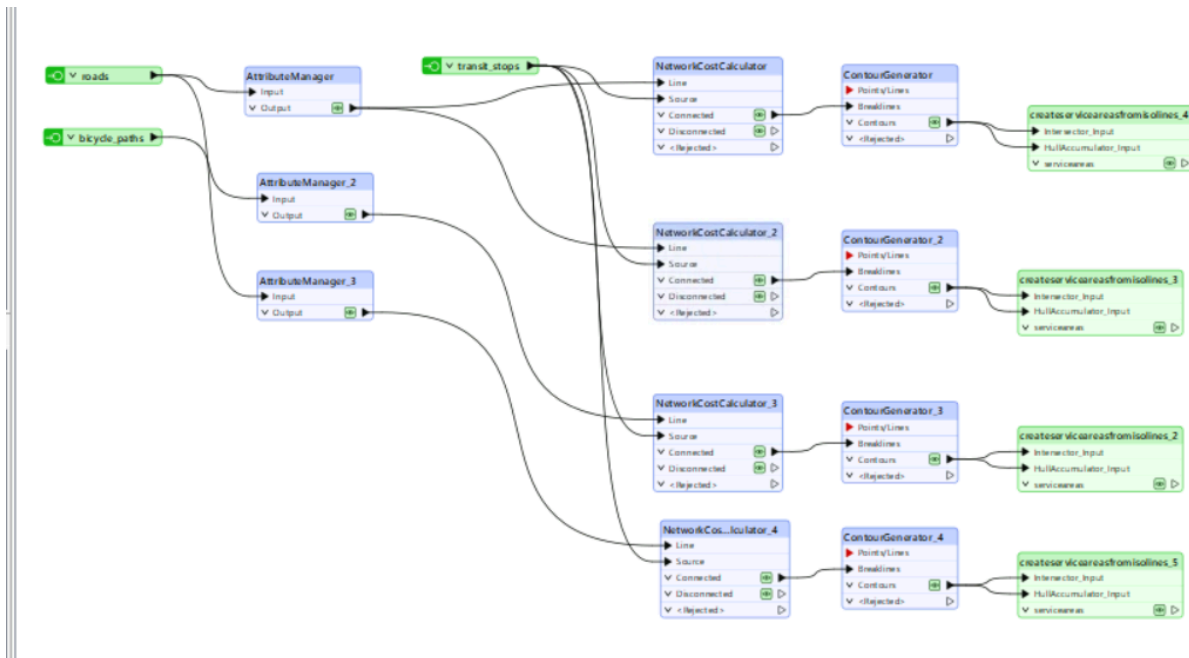

Find transit stops to use based on routes selected by user in user parameters. E.g. only select stops that are on route 1 and 2. Exclude stops which are not active

Service Area Calculation Custom Transformer

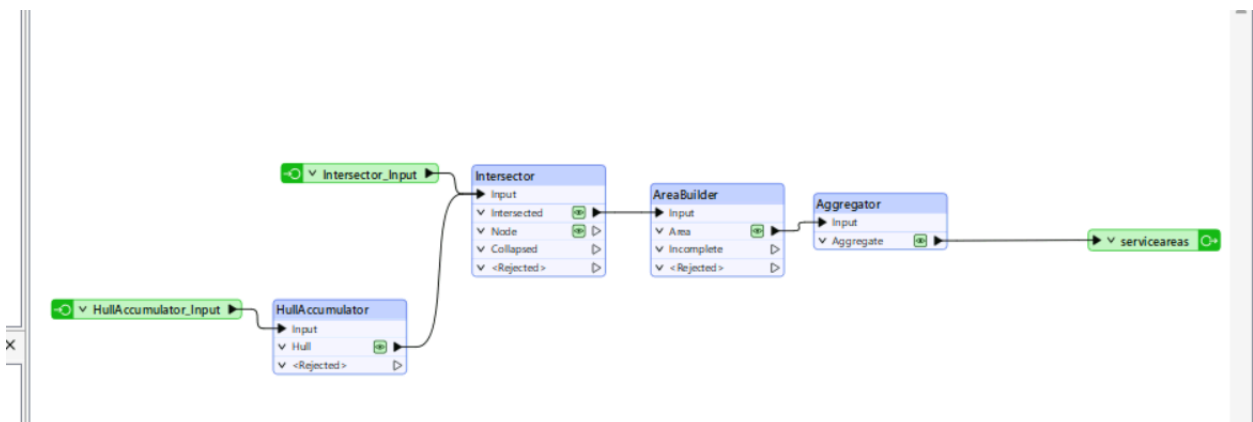

Takes bike routes, road network, and transit stops, then does service area generation /isolines

Custom transformer logic

This logic create service areas for walking time to transit route stops, driving time to transit route stops, and biking time to transit route stops. Service areas are output through another custom transformer.

Custom Transformer for Service Area polygon Generation

Generates service area polygons from service area isolines
